

Client Meeting Report

Project Title: City Savior: AI-ML Disaster Risk Prediction & Early Alert System

Client: Dyumani (Tech Mahindra software developer) and other officers

Submitted By:

CHEYATI HEMAVATHI- 2420030745

PILYANI PRIYANKA - 2420030132

REDDAM SRIJITHA - 2420030741

Date: [10/10/2025]

Meeting 1 – Project Scope & Client Expectations

Objective: To understand the client's vision, scope, and expectations from the AI-ML disaster risk prediction system.

Key Discussions: Current challenges, target disasters, stakeholders, desired outcomes.

Questions Raised:

- What types of disasters are the highest priority for the city?
- What challenges exist in the current disaster alert systems?
- What outcomes will define project success?
- How should the system interact with citizens and emergency agencies?
- How will alerts be prioritized for severity and geography?
- How should the project balance accuracy with speed of response?
- Why is early prediction more critical than post-disaster response?
- Why should citizens trust AI-generated alerts over traditional methods?
- Why is this system being prioritized at this time?

Outcome: The client emphasized floods and earthquakes as primary risks, with a strong requirement for multilingual alerts, integration with government agencies, and accuracy above 85%.

Meeting 2 – Data & Technical Infrastructure

Objective: To identify available data sources, technical requirements, and the role of AI-ML models.

Key Discussions: Data collection, storage, ML model selection, IT infrastructure.

Questions Raised:

- What historical and real-time datasets are available (weather, geospatial, IoT)?
- What are the existing data gaps that need to be addressed?
- What cloud platforms are approved for deployment?
- How will data from satellites and IoT sensors be integrated?
- How should the AI system handle incomplete or missing data?
- How will false positives/negatives be managed in predictions?
- Why must models be retrained regularly with new data?
- Why is explainability of AI predictions important for decision-makers?
- Why should cloud storage be preferred over local servers?

Outcome: The client confirmed availability of 15 years of disaster data, supported the use of cloud infrastructure, and emphasized the need for cybersecurity and explainable AI models.

Meeting 3 – Deployment & Stakeholder Integration

Objective: To plan how the system will be deployed, integrated, and operated across agencies.

Key Discussions: Multi-agency coordination, roles, communication channels, disaster drills.

Sample Questions Raised:

- What agencies should have priority access to the system?
- What are the most effective communication channels (SMS, sirens, apps)?
- What hardware will be required in city control centers?
- How should alerts be escalated between departments?
- How can citizen training and awareness be included in deployment?
- How should multilingual alerts be managed for inclusivity?
- Why is inter-agency communication currently a challenge?
- Why must hospitals and first responders receive alerts first?
- Why is redundancy critical in disaster communication?

Outcome: The client approved phased deployment, starting with pilot testing in flood-prone districts. Telecom operators will be engaged for SMS alerts, and hospitals will be integrated as first-line responders.

Meeting 4 – Evaluation & Future Roadmap

Objective: To finalize monitoring, evaluation metrics, and long-term sustainability.

Key Discussions: KPIs, citizen engagement, reporting, and scaling beyond the city.

Sample Questions Raised:

- What KPIs will define system success (accuracy, response time, citizen reach)?
- What error margin in predictions is acceptable?
- What role should third-party evaluators play in system audits?
- How should citizen feedback be collected and integrated?
- How will predictive accuracy be monitored over time?
- How should system updates be communicated to the public?
- Why is continuous citizen engagement necessary for trust?
- Why must the system evolve with climate change patterns?
- Why should predictive models undergo periodic audits?

Outcome: The client proposed quarterly audits, citizen engagement campaigns, and future scaling to nearby districts. A roadmap for continuous improvement and research collaboration with universities was endorsed.

Conclusion & Next Steps

Across four meetings, the client outlined clear expectations for City Savior. The system must:

- Focus first on flood and earthquake prediction.
- Ensure 85%+ accuracy with explainable AI.
- Support multi-agency coordination and multilingual alerts.
- Begin with pilot deployment in high-risk areas.
- Establish a long-term roadmap with regular audits and scaling potential.
